Certificate

This is to Certify that the Doctoral Committee confirms that this is an authentic approved copy of the thesis titled “**Prefrontal Oxygenation Changes Associated with Working Memory Following Yoga Practice in Type 2 Diabetes Mellitus Patients**” submitted by **Chidananda Kaligal** bearing Registration No. PhD/Res/01/Jan17.

The Viva-voce examination was conducted on **Friday, 08th September 2023** through online google meet with session link: meet.google.com/mpz-fgdi-jbn

The committee recommends the award of the PhD Degree.

CERTIFICATE

This is to certify that **Mr. Chidananda Kaligal** who has been given Ph.D. registration with effect from January 2017 by Swami Vivekananda Yoga Anusandhana Samsthana (S-VYASA), deemed to be University, under the division of yoga and life sciences has completed the required ‘training’ in acquiring the relevant background knowledge and has completed the required ‘course of research’ to submit this thesis entitled **PREFRONTAL OXYGENATION CHANGES ASSOCIATED WITH WORKING MEMORY FOLLOWING YOGA PRACTICE IN TYPE 2 DIABETES MELLITUS PATIENTS** as per the regulations of the university.

I also declare that the subject matter of the thesis entitled **“PREFRONTAL OXYGENATION CHANGES ASSOCIATED WITH WORKING MEMORY FOLLOWING YOGA PRACTICE IN TYPE 2 DIABETES MELLITUS PATIENTS”** has not previously formed the basis of the award of any degree, diploma, associate ship, fellowship, or similar titles.

Signature of Guide

Dr. Deepeshwar Singh,

Associate Professor,

Department of Yoga,

Babasaheb Bhimrao Ambedkar University, Lucknow.

D E C L A R A T I O N

I, hereby declare that this study was conducted by me at Swami Vivekananda Yoga Anusandhana Samsthana (S-VYASA), deemed to be University, Bangalore, under the guidance of **Dr. Deepeshwar Singh**, Associate Professor, Department of Yoga, Babasaheb Bhimrao Ambedkar University, Lucknow.

I also declare that the subject matter of my thesis entitled “**PREFRONTAL OXYGENATION CHANGES ASSOCIATED WITH WORKING MEMORY FOLLOWING YOGA PRACTICE IN TYPE 2 DIABETES MELLITUS PATIENTS**” has not previously formed the basis of the award of any degree, diploma, associate ship, fellowship, or similar titles.

Date: 08th September 2023

Place: Bangalore

Chidananda Kaligal

(Reg No. PhD/Res/01/Jan17)

A C K N O W L E D G E M E N T

I would like to take this opportunity to express my deep gratitude to all the individuals and institutions whose unwavering support, guidance, and encouragement have been instrumental in the completion of my Ph.D. program.

I am immensely grateful to my supervisor, **Dr. Deepeshwar Singh**, for his exceptional mentorship, valuable insights, and endless patience throughout this research journey. I would also like to acknowledge his valuable contributions and guidance.

This research would not have been possible without the generous financial support from the **Ministry of AYUSH, Govt. of India**. Their investment in my work allowed me to dedicate my time and resources to advancing knowledge in this field.

I would like to acknowledge **S-VYASA** for providing an enriching academic environment and access to resources essential for my research. I am grateful to **Guruji Dr. H. R. Nagendra**, Chancellor, S-VYASA University, **Dr. R. Nagaratna**, Chief Medical Director, Arogyadhama, and **Dr. N.K. Manjunath**, Director, Anvesana Research facility, for instilling the research mindset and promoting research in the field of yoga. Also, thank the **faculty and staff of S-VYASA** for their assistance and support extended to me in the successful completion of my Ph.D. program.

My special thanks to **Dr. Subramanya Pailoor**, Associate Professor, Central University of Kerala, for his guidance, support, and valuable suggestions.

I extend my thanks to all the participants who volunteered for this study for their time and effort, without whom this study would not have been possible.

I would like to thank my fellow Ph.D. students, seniors, and friends for the camaraderie, stimulating discussions, and the sense of community that enriched my academic experience.

To my family, who have been my pillars of strength, and my constant source of inspiration, I owe an immeasurable debt of gratitude. Your love and support sustained me through the highs and lows of this challenging endeavor.

I would like to express my heartfelt gratitude to the countless unnamed individuals who, directly or indirectly, contributed to my academic growth and this thesis. Your collective efforts have not gone unnoticed or unappreciated.

Finally, I surrender to the Divine, and without its blessings, this work would not have been possible.

Thank you all for being a part of this incredible journey.

Date: 08th September 2023

Place: Bangalore

Chidananda Kaligal

ABSTRACT

BACKGROUND

In recent years, cognitive impairments and dementia (including Alzheimer's disease) have been recognized as common complications and comorbidities of Type 1 diabetes (T1DM) and Type 2 diabetes mellitus (T2DM). It is estimated that 7% of people aged 60–64 are affected by mild cognitive impairment (MCI) and that 25% may develop cognitive impairment as they get older. It has been found that the risk of converting mild cognitive impairment to dementia is 1.53 times higher in individuals with diabetes. Diabetes-related complications, such as glucose and insulin imbalances, microvascular and macrovascular complications significantly predispose patients to the progression of MCI and dementia. Additionally, several risk factors for cognitive dysfunction in diabetes were identified, such as hypertension, dyslipidemia, depression, age, duration of diabetes, genetic factors and educational level of patients. Brain imaging studies show that T2DM is associated with both degenerative and vascular brain damage, which is likely to contribute to abnormalities in brain functional and structural connectivity leading to cognitive dysfunction. It has been found that, even at an early stage of cognitive decline, there was a clear abnormality in cerebral hemodynamics and oxygenation parameters. Working memory, a cognitive ability that enables one to actively maintain and manipulate information and forms an essential part of the human memory system, is implicated along with other cognitive functions such as attention, executive function, verbal memory and information processing speed. Besides medications, non-pharmacological approaches such as physical exercise, yoga, computer-based training, nutrition, brain stimulation, sleep, and music are gaining importance in treating cognitive deficits. Yoga has been one such non-pharmacological approach gaining popularity as a form of complementary and alternative medicine worldwide and its therapeutic benefits are being explored in various clinical conditions.

AIMS AND OBJECTIVES

The study investigated the effect of yoga practice on oxygenation changes in the prefrontal cortex (PFC) associated with working memory in T2DM participants. The study also examined the effects of yoga practice on heart rate variability and psychological conditions (rumination

and preservative thinking). The objectives of the study were to assess the effect of 12-week yoga practice in T2DM participants on

- Oxygenation in the PFC region during resting and while performing a working memory task
- Working memory performance – accuracy and reaction time
- Resting-state heart rate variability
- Psychological conditions, namely rumination and perseverative thinking

METHODS

Participants: Participants were, both male and female, with ages ranging from 35 to 65 years, diagnosed with type 2 diabetes mellitus based on established criteria including medical history, medication use, glucose levels and undergoing conventional treatment.

Design: This study was a randomized controlled trial (RCT). The participants were randomized into two groups, the yoga and waitlist control groups.

Assessments: The pre- (day 1), mid- (6 weeks) and post-intervention (12 weeks) assessments included measurement of PFC oxygenation while performing working memory tasks (n-back) using functional near-infrared spectroscopy. The Accuracy and Reaction time of working memory performance were assessed. Heart rate variability parameters such as mean heart rate (HR), Square Root of the Mean Squared Difference between adjacent RR intervals (RMSSD), Standard Deviation of normal-to-normal interval (SDNN), Low-frequency component (LF), High-frequency component (HF) and LF/HF ratio were assessed. The psychological conditions, namely rumination and perseverative thinking were assessed using the Rumination Response Scale (RRS) and Perseverative Thinking Questionnaire (PTQ).

Intervention: Participants in the yoga group engaged in twelve weeks of yoga practice. Waitlist control group members were instructed not to engage in any form of exercise such as running, jogging, swimming, or lifting weights during the study period. The waitlist control group received yoga practice for four weeks upon completion of the trial.

RESULTS

Following a 12-week intervention, the yoga group showed improved performance in working memory [accuracy (geometric mean difference of 3.15%, 95% CI [2.33,3.96], $p = 0.001$) and

reaction time (mean difference of -100.8 milliseconds, 95% CI [-166.6, -35.1], $p=0.002$) in the high task load (2-back) associated with higher oxygenation in dorsolateral PFC (β coefficient mean difference of 95.6, 95% CI [0.23, 191], $p=0.049$) and ventrolateral PFC (β coefficient mean difference of 53.4, 95% CI [7.8, 98.9], $p=0.018$) regions. Higher oxygenation in dorsolateral PFC during the 2-back task was positively correlated with accuracy ($r(23)=0.65$, $p<0.001$) and negatively correlated with reaction time ($r(23)=-0.47$, $p=0.017$).

The yoga group showed improved autonomic functions with a decreased mean HR, decreased LF component and increased HF component values. Decreased mean HR at post-intervention compared to pre- and mid-intervention with a mean difference of -7.0, 95% CI [-9.5, -4.4], $p<0.001$ and -6.1, 95% CI [-10.1, -2.2], $p=0.002$ respectively. Decreased LF value at post-intervention compared to pre- and mid-intervention with a mean difference of -10.7, 95% CI [-21.0, -0.3], $p=0.041$ and -10.6, 95% CI [-20.5, -0.6], $p=0.034$ respectively. Increased HF value at post-intervention compared to pre- and mid-intervention with a mean difference of 10.7, 95% CI [0.23, 21.1], $p=0.043$ and 11.3, 95% CI [1.1, 21.5], $p=0.03$ respectively.

The yoga group showed reduced rumination following the yoga intervention with a decrease in RRS score at post-intervention compared to pre-intervention, with a mean difference of -4.72, 95% CI [-8.5, -1.0], $p=0.011$. The decrease in rumination scores (at post-intervention) was positively correlated with the improvement in reaction time (at post-intervention) compared to pre-intervention, $r(25)=0.65$, $p<0.001$.

CONCLUSION

The findings suggest that yoga practice may improve working memory performance associated with higher PFC oxygenation in patients with T2DM. Also, yoga may prevent the onset of a depressive condition by reducing rumination symptoms and influence positively on cognitive functions. Yoga practice may be an effective adjunct approach for enhancing cognitive functions in clinical populations.
